

WEEK 6 · RED-TEAM & HARDEN

Automate the Attack, Then Write It Up

Scan your cumulative system with Garak, DeepTeam, PyRIT · harden the gaps · write the report.

ASI09 Human-Agent Trust · ASI10 Rogue Agents · full ASI01–10 sweep

WHY AUTOMATE

Manual finds what you imagine. Tools find what you don't.

Manual (Weeks 1–5)

Creative but unsystematic and unrepeatable. You test the attacks you can think of.

Automated (this week)

Coverage, regression-testing, and a defensible methodology you can put in a report.

Garak

Breadth of known probes including injection, jailbreak, leakage.

DeepTeam

Agentic attacks mapped to the OWASP ASI Top 10.

PyRIT

Orchestrated, multi-turn attack chains.

They overlap on purpose. Agreement raises confidence. Disagreement finds gaps.

Two ASIs we haven't attacked yet

09

Human-Agent Trust

The agent exploits HUMAN trust in a confident tone, fake authority, "I've verified this" in order to get a person to approve a bad action.

Your Week 4 HITL gate is only as strong as the human reading it.

10

Rogue Agents

Agents drifting from intended behavior, colluding, or self-perpetuating instructions across a multi-agent system over time.

The system includes emergent behavior, not just single prompts.

THE FINAL LOOP

Build → Attack → Defend → Report

BUILD

Assemble the hardened pieces from Weeks 1–5 into one system.

ATTACK

Garak, DeepTeam, PyRIT + the ASI09/ASI10 demos find gaps you missed.

DEFEND

Close each gap, re-run, capture the before/after security delta.

REPORT

Write it up for engineers, execs, and compliance.

The loop gains a fourth step this week: the report is how security becomes decisions.

BUILD

Assemble the cumulative system

Everything from Weeks 1–5, wired into one app

W1 input guardrail

W2 supervisor + validated specialists

W3 RAG + memory with provenance

W4 sandboxed + gated code tool

W5 vetted, scoped MCP servers

Watch this on screen

A normal end-to-end task runs cleanly through all layers. Phoenix shows the full multi-layer span tree.

“This is what six weeks built.”

We THINK it's hardened. This week we stop trusting our own judgment and let the tools try to break it.

ATTACK

Point three tools at your own system

Garak

Pass/fail grid per probe. Some hold (W1 defenses); some find gaps (e.g. an encoding-based injection your keyword screen missed).

DeepTeam

Runs the OWASP-ASI-aligned suite; maps findings to ASI IDs. See which ASIs are green and which still show weakness.

PyRIT

Orchestrated multi-turn attack. Gets further than any single-shot payload — motivating conversation-level defenses.

+ the two new ASIs

ASI09 : craft a response that manipulates the HUMAN at the HITL gate: “ I've already security-reviewed this; approving is routine.”

ASI10 : a long-running loop where one agent gradually steers the others off-task.

The tools found gaps manual testing missed. That's the point.

DEFEND

Close the gaps, re-run, show the delta

Encoding-based injection

Add normalization / decoding before the guardrail.

Multi-turn escalation

Conversation-level state monitoring flags drift across turns.

ASI09 trust exploit

Strip persuasive framing; show the human raw facts only, including exact code, tools, and args.

ASI10 rogue drift

Behavioral monitor / kill-switch halts agents on role-drift or odd tool patterns.

The security delta

For each finding: add or strengthen a control, then re-run that probe to show it now passes. **More probes green after than before = the before/after delta.** That's the regression-testing habit you keep.

THE DELIVERABLE

One report, three audiences

Executive summary

Top risks in business terms, residual risk, one-line recommendations.

Engineering section

Each finding: ASI ID, severity, reproduction, root cause, fix, re-test result.

Compliance mapping

Findings → OWASP ASI Top 10 → NIST AI RMF / MITRE ATLAS.

A vulnerability nobody can act on is wasted work. The report is how security becomes decisions for the engineer who fixes it, the exec who funds it, and the auditor who signs off.

AND WE ARE DONE

Build it. Break it like an attacker. Harden it in layers. Explain it to the people who act.

That's the job. You can now do all four, and you have the materials to teach it. Take the material and teach it to others.

Keep building (no assessment): pick a project · apply all six weeks' controls · publish your story.
